Software Engineering Student specializing in Machine Learning, Data Engineering, and ML Pipeline Development

TECHNICAL SKILLS

Core Concepts: Data Structures & Algorithms, OOP, DBMS, Operating Systems, Cyber Security

Programming Languages: Java, Python, C/C++, Android Programming (Java)

Web App Development: HTML, CSS, JavaScript

AI/ML: Machine Learning, Natural Language Processing, TensorFlow, NumPy, Pandas, Scikit Learn, Statistical Analysis

Tools: Microsoft Excel, Power BI, Jira, Firebase, Figma, Google Colab, GitHub, VS Code, Hadoop

Databases: MySQL, MongoDB, Apache Hive

Soft Skills: Analytical Thinking, Problem Solving, Critical Thinking, Communication, Team Collaboration

WORK EXPERIENCE

Hyntech Business Solutions, Chennai (Remote)

1 Jul 2025 – 28 Jul 2025

Frontend Developer Intern

- Engineered a responsive IAM dashboard using modern JavaScript, implementing secure authentication & dynamic data rendering for real-time tracking of IP and domain vulnerabilities, reducing manual monitoring by 35–40%.
- Integrated RESTful APIs to enable seamless client–server communication and efficient asynchronous data fetching, supporting real-time data updates across 3+ dashboard modules.

PROJECTS

Amazon Sustainability Classifier — Large-Scale NLP Pipeline (*Python, Hadoop, BERT, NLP, Scikit-learn*)

- Built a distributed text processing pipeline on Hadoop to handle a large-scale Amazon customer review dataset of 1,000+ reviews, applying MapReduce for efficient batch processing across commodity hardware.
- Performed end-to-end data wrangling and preprocessing using Pandas and NumPy, including tokenization, null handling, and numerical feature transformation to prepare structured inputs for model training.
- Developed a sentiment analysis module using NLP techniques and fine-tuned BERT embeddings to classify 1,000+ customer reviews as positive, negative, or neutral, improving classification precision over a baseline TF-IDF approach.
- Designed a multi-label classification system to tag products as sustainable or non-sustainable based on aggregated review signals — demonstrating end-to-end ML pipeline design from raw data to insight activation.

Paw Connect — Pet Care Service & Community Platform (*HTML, CSS, Node.js, MongoDB, REST API, GitHub*)

- Orchestrated end-to-end delivery from development to production via GitHub version control and cloud hosting, validating platform stability across booking, community feed, and messaging modules — backed by a Node.js and MongoDB service layer handling concurrent transactions, session management, and role-based data access.

Multimodal Grocery Recognition — Fusion Classification Pipeline (*Python, OpenCV, Scikit-learn, OCR*)

- Engineered a multimodal data fusion pipeline combining OCR-extracted text features and image-based visual features to classify grocery items, bridging structured and unstructured data modalities.
- Implemented and benchmarked multiple supervised ML classifiers (SVM, Logistic Regression, Random Forest), evaluating trade-offs in accuracy, precision, and recall — achieving ~90% classification accuracy on the final model.
- Created a modular preprocessing pipeline for feature extraction, normalization, and feature fusion, establishing reusable components across classification tasks.
- Deployed the classification pipeline as an interactive web application using Streamlit, hosted on Streamlit Community Cloud — managing version control and deployment workflow via Git/GitHub.

EDUCATION

Vellore Institute of Technology, Vellore

Expected 2027

MTech Software Engineering (Integrated) | CGPA: 8.57

Sunbeam CBSE, Katpadi

Jul 2020 – 2022

Grade 12: 79.2% | Grade 10: 84%

CERTIFICATIONS

- [Software Engineering Job Simulation – Accenture \(Forage\)](#)
- [Data Science and Analytics – HP](#)
